synergysolu PROMOTED — Oct 29, 3:12 AM

Hi there,

I need full help with the development of a simple app that recognizes and counts objects. Is that something you could do ?

If yes Ill send you more info.

Many thanks in advance.
Regards,
Tugrul

Me — Oct 29, 3:14 AM

Hello Synergysolu,

Thanks for choosing me to assist you.

Me — Oct 29, 3:16 AM

Yes, I can definitely help you develop an object recognition and counting app.

Please share more details about your idea, including how you want the app to recognize and count objects. I'll review the requirements and help you plan the best approach for your project.

Looking forward to hearing more from you.

Best regards,
Kajal

synergysolu — Oct 29, 3:18 AM

Sure ! Ill give you a quick introduction then ill need to go more into detail myself here. BUt at least you can ask some questions if there are any

synergysolu — Oct 29, 3:18 AM

I'm looking for a software developer who could help me build a custom app to make my work more efficient. Existing apps are often not accurate enough for what I need, so I'm considering developing a solution tailored to my requirements.
The main purpose of the app would be to use AI to identify and count different types of objects. We regularly work with large quantities of products, and I'm looking for a reliable and efficient way to automate and simplify this process.
I have already given the concept some thought, although the idea is still in its early stages and I haven't defined every detail yet.
Here are some of the features I have in mind:
• AI-powered object recognition and counting: The app should be able to recognize different object categories and count them as accurately as possible.
• Custom AI training: Users should be able to teach the AI to recognize new objects through an interface, for example, by uploading images of the objects from different angles and assigning names or categories to them (or however AI training works)
• Data export: Exporting results and counting reports to PDF and CSV.
• Offline functionality: The app should continue working without an internet connection and automatically synchronize data once a connection becomes available again.
•

********* optonal*********

• User and permission management: Different access levels for employees, supervisors, and managers.
• Web dashboard: A dashboard for managers to review, analyze, and manage counting records.
• External access through browser
• Extensibility and integrations: Ideally, the system should be designed to support additional object categories, predefined templates, and integrations with ERP systems such as SAP in the future.

The overall goal is to create a flexible AI-powered solution that can be adapted to different products and workflows rather than being limited to a fixed set of predefined objects.
Please note that this is only a rough outline of the concept, not a final specification. I still want to develop the idea further, think through the individual workflows, and define the exact requirements if the project is technically feasible.
At this stage, I would mainly like to know whether something like this is possible, what the technical challenges might be, and what kind of development effort, timeline, and budget I should expect.

Yes, of course, I have some questions in my mind.

What types of objects do you want the app to recognize and count?
Will users point their phone camera at objects in real time, or upload images or videos?
Do you need the app to count multiple objects automatically and display the total number?

synergysolu — Oct 29, 3:25 AM

What types of objects do you want the app to recognize and count? // things such as screws / stones / tablets (pill), coins, saltshakers, RAM sticks etc.
Will users point their phone camera at objects in real time, or upload images or videos? // in real time with the option to take a picture of that moment
Do you need the app to count multiple objects automatically and display the total number? // thats exactly what I want. for example (3 Apples, 5 Cucumber and 25 Screws)

Me — Oct 29, 3:28 AM

I've gone through your requirements carefully, and I believe I have a good understanding of your idea and what you're looking to achieve.

Based on your initial concept, here's a short list of the key features I understand you need:

- AI Object Recognition & Counting: Automatically identify and count different types of products with high accuracy.
- Custom AI Training: Allow users to add new products by uploading images and assigning names or categories.
- Offline Functionality: Continue counting without an internet connection and synchronize data when it becomes available.
- Data Export: Generate and export counting reports in PDF and CSV formats.
- User Management: Support different access levels for employees, supervisors, and managers.
- Web Dashboard: Allow managers to review counting records and analyze results.
- Future Scalability: Keep the system flexible for adding more product categories and integrating with ERP systems such as SAP.

The goal would be to build a reliable, flexible solution tailored to your actual workflow rather than a generic object-counting app.

I'd like to understand a little more about the products you handle and how your current counting process works. This will help me assess the technical approach, development timeline, and estimated budget more accurately.

synergysolu — Oct 29, 3:34 AM

we package all sorts of things for smaller companies who outsource it. we weigh the products by counting 10 / 50/ 100 / 150/ 250 pc by hand then make the average weight. Our customers complained about some deviation couple of times that there was a discrepancy.

synergysolu — Oct 29, 3:35 AM

otherwise its correct what you summarized. this part can also be optional actually: - User

From what I understand, the app should use the phone's camera to recognize and count multiple types of objects in real time, showing a separate count for each category. Users should also be able to take a picture and save the counting results.

Also, I get that you want the flexibility to add new types of objects, such as screws, coins, pills, or RAM sticks, by teaching the AI through example images.
